

# Some Simple Queries Against GBase

This page contains some simple queries that return lists of items from Google Base. Feel free to add your own examples.

In all the examples below, the base URL is "<http://base.google.com/base/feeds>". The URL "<http://www.google.com/base/feeds>" will also work.

## Specific Item

```
/snippets/11477332776408303929
```

Test.

## Specific Type of Item

```
/snippets?bq=[item type: Garden Accession]
```

Test.

or

```
/snippets?bq=[item type: "Garden Accession"]
```

Test.

or

```
/snippets/-/Garden%20Accession
```

Test.

Note that there appears to be a problem with Google Base where item types of "Test" and "Test Item" would be returned if searching just on "Test". The solution for now is to explicitly exclude longer names. So for example, to retrieve only "Botanic Garden" items, not "Botanic Garden Item" items:

```
/snippets?bq=[item type: "Botanic Garden"][item type: -"Botanic Garden *"]
```

Test with restriction and Test without restriction.

## Relations

Environmental data associated with a garden:

```
location = parseFeed("[item type: botanic garden][]")
```
